Beyond Condemnation and Shame

Improving Awareness and Treatment of Children with Fetal Alcohol Spectrum Disorders and Co-Occurring Psychiatric Disorders

Douglas Waite, MD
Assistant Professor of Pediatrics, Mount Sinai Hospital
Medical Director
The Keith Haring Clinic at Children’s Village
Dobbs Ferry, New York
Challenges to FASD Diagnosis and Treatment

- The Stigma of Alcoholism
- The Difficulty of Diagnosis and Lack of Professional Awareness of FASD
- Between Systems: The Absence of FASD-specific Intervention Programs
- Diverse Advocates (biological parents, foster care)
- Culturally Sanctioned Alcohol Promotion versus Public Education
“Each of their mothers was an alcoholic” 1973

Causes of Intellectual Disability

- Fragile X (most common inherited cause of intellectual disability) estimated to affect about 1 in 5,000 males (0.02%)
- Trisomy 21 (most common chromosomal cause of intellectual disability) has a prevalence of 0.14% (0.14/100)
- FASD (most common cause of all intellectual disabilities) estimates range from 0.5-2% of all births (1/100)
The Scope of the Problem

Between 2005 through 2010, on average 7.5 million children—about 10.5 percent of the country's under-18 population—lived with a parent abusing alcohol during any given year (Substance Abuse and Mental Health Services Administration (SAMHSA))
FASD 40 Years Later (1973-2013)

• Why does the diagnosis of FASD remain rare while social drinking during pregnancy is so common?
• Why do so few FASD-specific treatment programs exist?
Identification of Children with FASD

Intervention, Treatment and Prevention
The Strange, Sad Tale of Phineas Gage
“The equilibrium or balance, so to speak, between his intellectual faculties and animal propensities, seems to have been destroyed. He is fitful, irreverent, indulging at times in the grossest profanity (which was not previously his custom), manifesting but little deference for his fellows, impatient of restraint or advice when it conflicts with his desires, at times pertinaciously obstinate, yet capricious and vacillating, devising many plans of future operations, which are no sooner arranged than they are abandoned in turn for others appearing more feasible. A child in his intellectual capacity and manifestations, he has the animal passions of a strong man. Previous to his injury, although untrained in the schools, he possessed a well-balanced mind, and was looked upon by those who knew him as a shrewd, smart businessman, very energetic and persistent in executing all his plans of operation. In this regard his mind was radically changed, so decidedly that his friends and acquaintances said he was "no longer Gage."
Developmental Age and FASD

Actual age = 18 years

Source: Adapted from: Research findings of Streissguth, Clarren et al. Diane Malbin, 1994
Defining Neurobehavioral Characteristics of Children with FASD

- Impaired Executive function (conscious, goal-oriented behavior such as planning, execution, working memory, and inhibition of impulses in pursuit of goals)
- Behavioral dysfunction manifested by deficits in social functioning (aggressive and impulsive behavior)
- Attention and distractibility
- Language (auditory processing disorder, mixed receptive-expressive language disorder)
- Most children have borderline to low average cognitive ability

The Difficulty of Diagnosis

- Histories of maternal alcohol consumption during pregnancy are often unknown and meconium and hair testing are expensive currently not mandated
- Criteria of fetal alcohol syndrome (facial characteristics, history of alcohol exposure) are not known by most physicians, psychologists and social workers
- Lack of biological markers (sensitive and specific physical findings, blood tests, MRI)
- Lack of sensitive and specific means of diagnosing FASD based upon neurobehavioral phenotype (*children with FASD look like the rest of the psychiatric population*)
- Clinicians and professionals have been reluctant to diagnose their children because there were no known effective treatments.
Histories suggestive of possible prenatal alcohol exposure

- Early placement in foster care (secondary to abuse or neglect, abandonment, termination of parental rights or early death of mother or father)
- Primary guardian other than the child’s mother
- Early childhood behavioral and school difficulties
- Low birth weight, miscarriage, developmental delay or sibling born with positive urine toxicology (cocaine), successively poorer pregnancy outcomes
- Family history of alcoholism or substance abuse
- History of domestic violence
Almost two thirds (63%) of children with FASD suffer from at least one psychiatric syndrome that in contrast to physical features of FAS, are long-lasting, pervasive and devastating to development.

$^a$ Only the diagnoses or problems with prevalence $\geq4\%$ are displayed; total $n = 2,231$.

$^b$ Four-digit diagnostic code as described by Astley and Clarer (1999, 2000) was used to determine risk for gestational exposure.
Between Systems of Service

• While approximately 50% of children with FASD are have intellectual disability (IQ<70), many children with a diagnosis of FASD are ineligible for special services because their intellectual abilities often fall within the average range of intelligence.

• While many children with FASD have co-existing psychiatric diagnoses, these diagnoses lack long-term systems of care compared to those diagnoses such as schizophrenia and bipolar disorder, where long-term models of care exist.
The Trajectory of FASD

- 61% have disrupted school experiences
- 60% become involved with the criminal justice system
- 50% are incarcerated
- 49% have inappropriate sexual behaviors
- 35% have drug and alcohol problems
Fetal alcohol syndrome in the United States corrections system

- Of the 3,080,904 offenders, only one offender was reported to have a diagnosis of FAS.
- One program (1.9%) reported having a screening program for FAS in the corrections system.
- Only four programs (7.4%) reported having access to diagnostic services for FAS in the corrections facilities.
- Specialized programs for persons with mental retardation were reported for 44.4% of corrections facilities and 25.9% of community corrections facilities.

Risk Factors for Adverse Life Outcomes in Fetal Alcohol Syndrome and Fetal Alcohol Effects

Eighty percent of these patients were not raised by their biological mothers. For adolescents and adults, the life span prevalence was 61% for disrupted school experiences, 60% for trouble with the law, 50% for confinement (in detention, jail, prison, or a psychiatric or alcohol/drug inpatient setting), 49% for inappropriate sexual behaviors on repeated occasions, and 35% for alcohol/drug problems. The odds of escaping these adverse life outcomes are increased 2- to 4-fold by receiving the diagnosis of FAS or FAE at an earlier age and by being reared in good stable environments.

The Discovery and Evolution of Fetal Alcohol Syndrome

“The observers of FAS indeed identified an ‘evil which profoundly disturbed them,’…yet their medical expertise granted them no more power to prevent its occurrence or ameliorate its sequelae than anyone else…Yet in assuming that improved outcomes rest on individual change, rather than broader change in the social conditions that put individuals at risk, these clinicians thus made FAS merely a victim-blaming strategy…What they could not cure as physicians, they hoped to banish as moralists.”

A Moral Disorder?

- Substance Abuse
- Child Abuse and Neglect
- Psychiatric Illness
- Poverty
- Criminal behavior
- Fetal Alcohol Spectrum Disorders ("intra-uterine child abuse")
- "Good kids who do bad things"
Interventions for Children with FASD

• Children with cognitive and behavioral issues related to prenatal alcohol exposures most often come to the attention of the educational system because of the learning and/or behavioral issues they display, not because they have a known diagnosis of FAS.
• When this happens, schools are mandated under federal law (IDEA) to initiate an assessment of the child’s individual abilities and challenges.
• The inclusion of children with special needs within regular classrooms whenever possible (educating children within the least restrictive environment)

Interventions
Structured, consistent and realistic interventions

- Realistic expectations
- Consistent routines
- Limited stimulation
- Concrete language and examples
- Multi-sensory learning (auditory, visual and tactile)
- Supportive environments
- Supervision
Because of the persistent nature of the impairments associated with prenatal alcohol exposure, there is need for interventions that address the manifestations of these impairments across the entire life-span.

“Tell the boys of New York Juvenile Asylum that they must follow Truth, Justice and Humanity if they wish to become useful and honorable men.”
